

**DIFFERENTIAL RING
FOR TRIUMPH ROCKET III
#TR3090**

1. Remove the screw and nut from the ring. Peel the protective film from the double sided tape on the inside of the cover. Install the ring over the differential by flexing it open **only far enough to slide over** as bending the cover may crack the chrome plating.
2. Rotate the ring so that the open end is facing the front of the motorcycle with the gap and screw being hidden behind the drive shaft housing. Place the screw thru the top hole of the cover, wrap the cover snugly around the differential with the raised portions of the ring fitting over those of the differential and the screw going thru the other hole. Install the locking nut (it may be helpful to have another person hold the ring in place while you get the nut started).
3. Check to see that the ring is aligned both over the raised parts of the differential and its outer edge aligns with the edge of the black plastic ring all the way around. Tighten the screw while holding the nut with a wrench enough to hold the cover firmly in place but not so tight as to bend the tabs where the screw goes thru the cover. Check the cover periodically for tightness and that its position has not shifted.
